"There is insufficient information to determine the site-wide human exposure status at the Cabo Rojo Ground Water Contamination site. Samples collected at the drinking water wells show that chlorinated compounds such as PCE and TCE are in the ground water at concentrations below the MCLs. These contaminants are potentially harmful to human health and many of them can easily evaporate into the air. EPA has initiated comprehensive remedial investigation activities at the site to further characterize the nature and extent of the contamination at the site and to prepare risk assessments to determine the potential impacts to human health and the environment.

EPA ensures community participation throughout the remedial process by meeting with residents and affected stakeholders, issuing public notices and updating fact sheets. Additionally, an EPA Community Involvement Coordinator is assigned to the site and can address specific community concerns as they arise."

Subject: Insufficient Data paragraphs needed - action required

Hello all..

Once a site is proposed to the NPL or listed as final to NPL an Insufficient paragraph is required in CERCLIS. This is to let HQ and the public know that no human exposure determination for the site has not yet been made. The following sites are missing Insufficient data paragraphs in CERCLIS.

Please provide paragraphs for these sites by June 13th, if possible. If you have any questions or need assistance, please let me know.

Site Name	NPL listing
-----------	-------------

Hormigas	F
Cabo Rojo	F

New Cassel/Hicksville	P
Garfield	P

Here is an example of an Insufficient Data paragraph created for Newton Creek site that may assist you. Please follow this format in creating your paragraphs.

There is insufficient information to determine the site-wide human exposure status at the Newtown Creek site. Numerous sampling events have shown the sediments in the Newtown Creek and its tributaries to be contaminated with a variety of pollutants, including pesticides, metals, polychlorinated biphenyls (PCBs) and volatile organic compounds (VOCs). These contaminants are potentially harmful to human health and many of them can easily evaporate into the air. Numerous sediment samples have been collected from the Newtown Creek and its tributaries during previous investigations. EPA has initiated comprehensive remedial investigation activities at the site to further characterize the nature and extent of the contamination at the site and to prepare risk assessments to determine the potential impacts to human health and the environment.

EPA ensures community participation throughout the remedial process by meeting with residents and affected stakeholders, issuing public notices and updating fact sheets. Additionally, an EPA Community Involvement Coordinator is assigned to the site and can address specific community concerns as they arise.

Thanks
